WO 2026/087928 A1

(54) **Title:** AI CLOTHING RECOMMENDATION SOFTWARE BASED ON USER INPUT, PERSONAL INFORMATION AND OCCASION

(57) **Abstract:** This invention is an AI software that helps determine what type and color of clothing to wear for various events and occasions (formal and informal) and for specific individuals. The user provides details about the upcoming event or occasion. This can include the type of event, the time of day, the season, and any specific dress codes mentioned. The user may also input personal information such as their body type, skin tone, hair color, and style preferences. Based on the input data, the software can suggest specific outfits and color combinations. The software can also be context aware. For instance, it might provide different recommendations based on cultural norms or the user's location. As the user provides feedback on the recommendations (e.g., how they felt wearing the suggested outfit), the software can improve its future suggestions using reinforcement learning techniques.

Description

Title of Invention: AI Clothing Recommendation Software Based on User Input, Personal Information and Occasion

[0001] The innovative technology being described here is an artificial intelligence software designed to assist users in selecting the most suitable type and color of clothing for a wide range of events, both formal and informal, tailored specifically to individual preferences. To utilize this software, users are required to input details about the upcoming event or occasion, which may include the nature of the event, the time of day, the season, and any dress codes that may be in place. Additionally, users can provide personal information such as their body type, skin tone, hair color, and preferred style choices.

[0002] Once the software has gathered all the necessary information, it is able to generate recommendations for outfits and color combinations based on the user's input data. Moreover, the software is designed to be context-sensitive and can take into account various factors such as cultural norms or the user's geographical location when offering suggestions. This ensures that the recommendations provided are not only stylish but also appropriate for the specific event and the individual using the software.

[0003] As users begin to use the software and interact with the outfit recommendations provided, they have the opportunity to provide feedback on how the suggested outfits made them feel. This feedback loop allows the software to continuously learn and improve its recommendations over time through reinforcement learning techniques. By incorporating user feedback into its algorithms, the software is able to fine-tune its suggestions and offer more personalized and accurate outfit recommendations to users in the future.

Background Art

[0005] KR1020150056900

[0006] PRACTICAL FASHION APPLICATION UTILIZING SNS AND WEATHER INFORMATION OF SMARTPHONE

[0007] The present invention relates to a fashion application using a smartphone. Unlike other existing fashion-related applications, the fashion application is user-friendly and is capable of being practically used. A user uploads the pictures of the clothes he or she actually owns. The user can directly coordinate the clothes in a virtual wardrobe and stores the coordination options. The application can recommend one of the stored coordination options according to the weather condition of the day. Accordingly,

the present invention can reduce the time to select clothes for the day and share the coordination options with friends to prevent the users choice overlapping with that of the others.

[0008] This invention is similar to our claimed patent in their consideration of user inventory and weather conditions, but the recommendations are more limited than ours because they do not include the type of event, the user's body type, skin tone, hair color, and preferred style choices.

[0009] CN111311365

[0010] DRESSING RECOMMENDATION SYSTEM BASED ON WEATHER INFORMATION

[0011] The invention discloses a dressing recommendation system based on weather information, and the system comprises a database unit which is used for storing the data information of personal clothes of auser, and carrying out the marking and classification of the stored data information of the personal clothes of the user; the dressing recommendation unit which is used for automatically comparing andanalyzing the personal preference data and the weather condition information with the data information of the personal clothes of the user stored in the database unit to generate dressing recommendation information and life related information; and the information display unit which is used for receiving the dressing recommendation information and the life-related information generated by the dressing recommendation unit and performing display and intelligent voice playing. The system can intelligently analyze and recommend dresses according to weather conditions, and can input personal preference information of a user for screening and analysis, so that dressing recommendation information can meet preference requirements of the user, and the use experience of the user is improved; in addition, life-related information can be generated, and daily application requirements are enriched.

[0012] The mentioned invention is similar to our software in their personal data collection and recommendation services, however, its primary deciding factor is weather conditions, while ours includes many other factors and provides more specific recommendations. Also, this system does not use artificial intelligence and is not as accessible.

[0013] KR1020190060941

[0014] APPLICATION FOR RECOMMENDING USER PRIME;S CLOTHES ACCORDING TO WEATHER AND TEMPERATURE

[0015] The present invention relates to an application which recommends user prime;s clothes according to the weather and the temperature. The present invention enables a user to be recommended with the user prime;s clothes according to the weather and select the recommended clothes to complete the user prime;s coordination so

that individuality can be expressed, thereby solving a problem of taking much time to choose the clothes because the user is not recommended with the clothes and the user has to coordinate the clothes. That is, the present invention, in a clothes recommendation application, consists of: a recommended coordination icon for recommending and photographing 2 to 3 kinds of clothes among the user prime;s clothes which match the temperature and the weather of the region, the temperature, and the weather screen related to the weather information on a smartphone constituting the temperature, fine dust, and weather on the two split upper ends on the screen to be confirmed after recognizing the user prime;s location with GPS or setting a region through a user setting, and recommending 3 kinds of clothes sorted for small classification according to the temperature; a possessed coordination icon for viewing the possessed clothes by large and small classification, and identifying possessed coordination by classification; a clothes photographing icon for photographing the clothes by operating a camera application of the smartphone so that the possessed clothes can be photographed and stored; and a stored coordination icon for storing the coordination in a gallery and identifying the coordination by making the coordination in one picture so that the set made of the recommended coordination can be stored and identified.

[0016] This invention resembles our claimed patent in the sense that they both offer outfit coordination services but the function here is limited to the temperature while our software considers various other factors as well.

[0017] CN111191135

[0018] CLOTHING MATCHING RECOMMENDATION METHOD AND SYSTEM

[0019] The embodiment of the invention provides a clothing matching recommendation method and system. In the practical application process, a user inputs information through an information acquisition module, wherein the information comprises an attendance occasion, the current season and the like; the data processing module acquires clothing matching matched with the current information according to theinput information; comparing the clothing matching with the existing clothes information of the user to find clothing matching which is the same as or closest to the clothing matching; and displaying the clothing matching to the user. By adopting the clothing matching recommendation method and system provided by the embodiment of the invention, the user can obtain the clothing matching based on the existing clothes of the user. In addition, the clothing matching is matched with the user demand, so that the user experience is improved.

[0020] This invention provides event-specific recommendation and considers similar factors to our software. However, It does not utilize an artificial intelligent mechanism and does not feature social sharing or contextual awareness.

[0021] CN112270221

[0022] CLOTHES PERSONALIZED RECOMMENDATION METHOD FUSING FOUR-SEASON COLOR THEORY

[0023] The invention discloses a clothing personalized recommendation method fusing a four-season color theory. The clothing personalized recommendation method is specifically carried out according to the following steps. The method comprises the following steps: step 1, acquiring face image information by utilizing a crawler technology, and establishing a four-season color theoretical data set of user skin color; step 2, processing the input face image by using an MTCNN network, then fusing transfer learning and a MobileNet network based on a self-diagnosis color season type technology, and then constructing a four-season color theoretical model of the skin color of the user; 3, training the garment data set by using a multi-output classification method, and classifying the styles and colors ofthe garments by using a FahionNet network to obtain a garment classification model; and 4, recommending the user clothes according to the four-season color theoretical model and the clothes classification model of the skin color of the user. According to the invention, personalized clothing recommendation coordinated with the facial features of the user is realized, and the method has relatively high accuracy in practical application.

[0024] This mentioned system also provides personalized outfit coordination options, however, it is not artificially intelligent and its main focus is color theory, while ours considers numerous aforementioned factors in the process.

[0025] US20210287274A1

[0026] Methods and systems for a all-in-one personal fashion coaching and assistance using artificial intelligence and peer-to-peer network databases

[0027] A method and system for providing an all-in-one personal fashion coaching and assistance readily to be used on a communication device of a user are disclosed, which includes: (a) providing clothing fitness services use after receiving input images and personal parameters from users; (b) providing try-on services using the body model and measurements and input images of F&A items; (c) providing smart style services by matching input images of F&A items extracted from past and current fashion and apparel (F&A) image files exchanged in a peer-to-peer manner among users and sellers; (d) providing a recommendation services to users by finding fashion trends, stores, locations, and suitable discounted prices.

[0028] This mentioned invention is very similar in it's mechanisms and procedures to our claimed patent. However, this system focuses ultimately on providing an improved shopping experience for the user, while ours is about offering personalized and specifically tailored fashion assistance. Moreover, this invention does not consider the

cultural context and social appropriateness, whereas our software includes these factors in the recommendation.

[0029] United States Patent 11049164

[0030] Coordinated event based wardrobe recommendation

[0031] One embodiment provides a method, including: receiving a user wardrobe query related to at least one item in a user's wardrobe to be worn for an event, wherein the user wardrobe query corresponds to at least one of an outfit recommendation query and an outfit sharing query; accessing a database comprising user profiles, each of the user profiles comprising (i) a listing of the at least one item in a user's wardrobe, (ii) at least one attribute of a user, and (iii) feature information for each of the at least one items indicating a feature of the item; determining at least one score for each of the at least one items; and providing at least one recommendation responsive to the user wardrobe query, wherein the at least one recommendation comprises an item from the user's wardrobe or another user's wardrobe having a score above a predetermined threshold.

[0032] The mentioned invention has a lot in common with the idea behind our patent design, in that they are both able to provide event specific coordinated outfits based on user input, but this method does not use artificial intelligence and is not as user friendly or accessible.

[0033] United States Patent Application 20200193502

[0034] RECOMMENDATION ENGINE FOR CLOTHING SELECTION AND WARDROBE MANAGEMENT

[0035] A system is disclosed that makes recommendations on what to wear or purchase based on what articles of clothing make up the user's wardrobe and trends on what they wear. Additionally, the system can access other users with similar wardrobes, in aggregate, to make suggestions on what to wear or purchase to follow current styles or trends.

[0036] This patent is similar to our claimed invention in its function but it does not benefit from artificial intelligence and a user friendly accessible interface. Also, this system focuses primarily on wardrobe inventory, while our method takes several other factors into account as well.

Summary of Invention

[0037] This invention involves an artificially intelligent software that offers personalized fashion recommendations for various events and specific individuals. This software utilizes user input and profile creation, so the recommendaions will take into account the users' personal information, location, wardrobe inventory, event details, fashion trends, color theory, cultural context and social norms. The system has the ability to be context-aware and understands the specific event and the target audience in order

to tailor its recommendations to ensure appropriateness and style. It can be available as a mobile app and a web-based platform, ensuring accessibility and convenience. The application features an interactive interface, a virtual fitting room, social sharing and e-commerce integration. It can also employ reinforcement learning techniques to continuously refine its recommendations and become more precise and personalized.

Technical Problem

[0038] Previous software could only determine the type of clothing and did not take into account the type of events, or the specific individual being addressed, which was a major drawback.

[0039] Previous fashion recommendation software often had limitations. They typically focused on suggesting outfits based on general fashion trends or simple user preferences. However, these tools did not consider the specific context of different events, or the unique characteristics of the individuals involved, which are crucial factors for making appropriate and personalized clothing choices. This lack of contextual awareness and personalization was a significant shortcoming, reducing the effectiveness and relevance of the recommendations provided.

[0040] By incorporating AI and machine learning to analyze the nuances of different events and the individual preferences and characteristics of the user, the new software aims to overcome these limitations and offer more tailored and contextually appropriate fashion advice.

Solution of Problem

[0041] Fashion plays a crucial role in social interactions and personal expression. With the advancement of artificial intelligence (AI) and machine learning (ML), creating a software solution that offers personalized fashion recommendations for various events and specific individuals is now feasible. This solution addresses the limitations of previous systems that only determined the type of clothing without considering the context of the events or the characteristics of the individuals involved.

[0042] User Input and Profile Creation

[0043] The first step in providing personalized fashion advice is gathering comprehensive user input. Users will create a detailed profile that includes:

[0044] Personal Information: Details such as age, gender, body type, skin tone, hair color, and style preferences.

[0045] Wardrobe Inventory: Users can upload photos or descriptions of their existing wardrobe, allowing the software to make recommendations based on what they already own.

[0046] Event Details: Information about the upcoming event, including the type of event (e.g., wedding, business meeting, casual outing), time of day, season, location, and any specific dress code requirements.

[0047] Target Audience: Information about the individuals they will be interacting with, such as their relationship to the user (e.g., boss, date, friends), which can influence the formality and style of the recommended attire.

[0048] Machine Learning Models and Data Analysis

[0049] To generate accurate recommendations, the software will utilize advanced ML models trained on vast datasets that include:

[0050] Fashion Trends: Current and historical fashion trends, which help the system stay updated with what's in style.

[0051] Color Theory: Knowledge of color combinations that work well together and complement different skin tones.

[0052] Social Norms: Understanding of appropriate dress codes for various events and cultural contexts.

[0053] User Feedback: Data from previous recommendations and user feedback to continuously improve the accuracy and relevance of suggestions.

[0054] Context-Aware Recommendations

[0055] The software's ability to be context-aware is a key differentiator from earlier solutions. By understanding the specific event and the target audience, the system can tailor its recommendations to ensure appropriateness and style. For instance:

[0056] Formal Events: For a business meeting with a senior executive, the software might suggest a tailored suit in neutral colors, paired with conservative accessories.

[0057] Casual Outings: For a casual date, it might recommend a trendy but comfortable outfit that reflects the user's personal style while being appropriate for the setting.

[0058] Cultural Considerations: If the event has cultural significance, the software can suggest attire that respects and reflects cultural norms and expectations.

[0059] Integration and User Experience

[0060] The software will be available as a mobile app and a web-based platform, ensuring accessibility and convenience. Key features will include:

[0061] Interactive Interface: A user-friendly interface that allows users to input their details easily and browse recommendations visually.

[0062] Virtual Fitting Room: A feature that allows users to see how recommended outfits might look on them using augmented reality (AR) technology.

[0063] Social Sharing: The ability for users to share their outfits with friends or seek feedback from a community of fashion enthusiasts.

[0064] E-commerce Integration: Links to purchase recommended items online if they are not already in the user's wardrobe.

[0065] Continuous Learning and Improvement

[0066] The software will employ reinforcement learning techniques to continuously refine its recommendations. By analyzing user feedback on the outfits they wear, the system will improve its understanding of individual preferences and the subtleties of different social contexts. Over time, this will lead to more precise and personalized fashion advice.

[0067] Conclusion

[0068] By leveraging AI and ML, this fashion recommendation software aims to provide highly personalized, context-aware fashion advice. It overcomes the limitations of previous solutions by considering the specific event, the individual's unique characteristics, and the social context, thereby ensuring users always look their best, feel confident, and are appropriately dressed for any occasion.

Advantage Effects of the Invention

[0069] 1. Personalized Recommendations

[0070] 2. Context-Aware Suggestions

[0071] 3. Timesaving

[0072] 4. Enhanced Shopping Experience

[0073] 5. Trend Awareness

[0074] 6. Sustainable Fashion Practices

[0075] 7. Confidence Boost

[0076] 8. Cultural Sensitivity

[0077] 9. Continuous Improvement

[0078] 10. Accessibility

[0079] 11. Integration with Image Consulting

[0080] 12. Industrial Applicability

Brief Description of Drawings

[0081] [Fig.1] Shows a flowchart of the software's function.

Description of Embodiments

[0082] [Fig.1] Shows the software's procedures and function flowchart. First the user creates their profile, and provides detailed personal information such as age, gender, body type, skin tone, hair color, and style preferences.They also enter photos and descriptions of their wardrobe inventory and event details, including the type of event (e.g., wedding, business meeting, casual outing), time of day, season, location, and any specific dress code requirements.They also provide information about the target audience they will be interacting with, such as their relationship to the user (e.g., boss, date, friends), which can influence the formality and style of the recommended attire.

[0083] In order to generate precise recommendations, the software will utilize advanced ML models trained on vast datasets that include: fashion trends, color theory, social norms and user feedback. The software generates context-aware suggestions by understanding the specific event (e.g. formal, casual) and cultural considerations. The software can be used as a mobile app and a web-based platform, and it features an interactive interface, virtual fitting room, social sharing, e-commerce integration and reinforcement learning for improving the personalized recommendations.

Examples

[0084] The invention provides highly personalized fashion advice by taking into account a wide range of individual characteristics, including body type, skin tone, hair color, and style preferences. This ensures that each recommendation is tailored specifically to the user, enhancing their confidence and satisfaction with their appearance.

[0085] Unlike traditional fashion recommendation systems, this software considers the specific context of events. It tailors its suggestions based on the type of event, location, time of day, season, and any cultural or dress code requirements. This context-aware approach ensures that users are appropriately dressed for every occasion.

[0086] By allowing users to upload their existing wardrobe inventory, the software can make recommendations that utilize items they already own. This not only helps users make the most of their current wardrobe but also encourages sustainable fashion practices by reducing the need for new purchases. The software uses machine learning to continuously improve its recommendations. By analyzing user feedback and preferences, it becomes more accurate over time, providing better and more relevant fashion advice with each use.

[0087] The software is constantly updated with the latest fashion trends and styles. This ensures that users receive advice that is both modern and stylish, keeping them up-to-date with current fashion movements without the need to follow trends manually.

[0088] With augmented reality (AR) technology, the software offers a virtual fitting room feature. This allows users to visualize how recommended outfits will look on them before trying them on in real life. This feature enhances the shopping experience and reduces the guesswork involved in choosing new clothes. The software can be integrated with e-commerce platforms, providing users with direct links to purchase recommended items. This seamless integration simplifies the shopping process, making it easy for users to acquire the pieces they need to complete their outfits.

[0089] The social sharing feature allows users to share their outfits with friends or seek feedback from a community of fashion enthusiasts. This social aspect not only provides additional validation and confidence but also creates an engaging user experience.

[0090] The software takes into account cultural norms and traditions, offering recommendations that respect and reflect cultural dress codes and practices. This is particularly beneficial for users who attend diverse events and need to navigate various cultural expectations.

[0091] Available as both a mobile app and a web-based platform, the software offers flexibility and convenience. Users can access fashion advice anytime and anywhere, making it a practical tool for busy lifestyles.

Industrial Applicability

[0092] This invention will be very widely used in fashion retail. Retailers can integrate this software into their online platforms, offering personalized fashion recommendations to customers in order to boost their sales and predict demand more accurately.

[0093] Fashion brands, event planners, image consultants, media influencers and fashion educators can all benefit from this software in numerous ways for research, marketing campaigns, organizational fashion design and content creation.

[0094] This software can also be installed in smart closets and become a well-adjested addition to a smart household experience.

Claims

[Claim 1] An artificially intelligent software solution is designed that offers personalized fashion recommendations for various events and specific individuals.

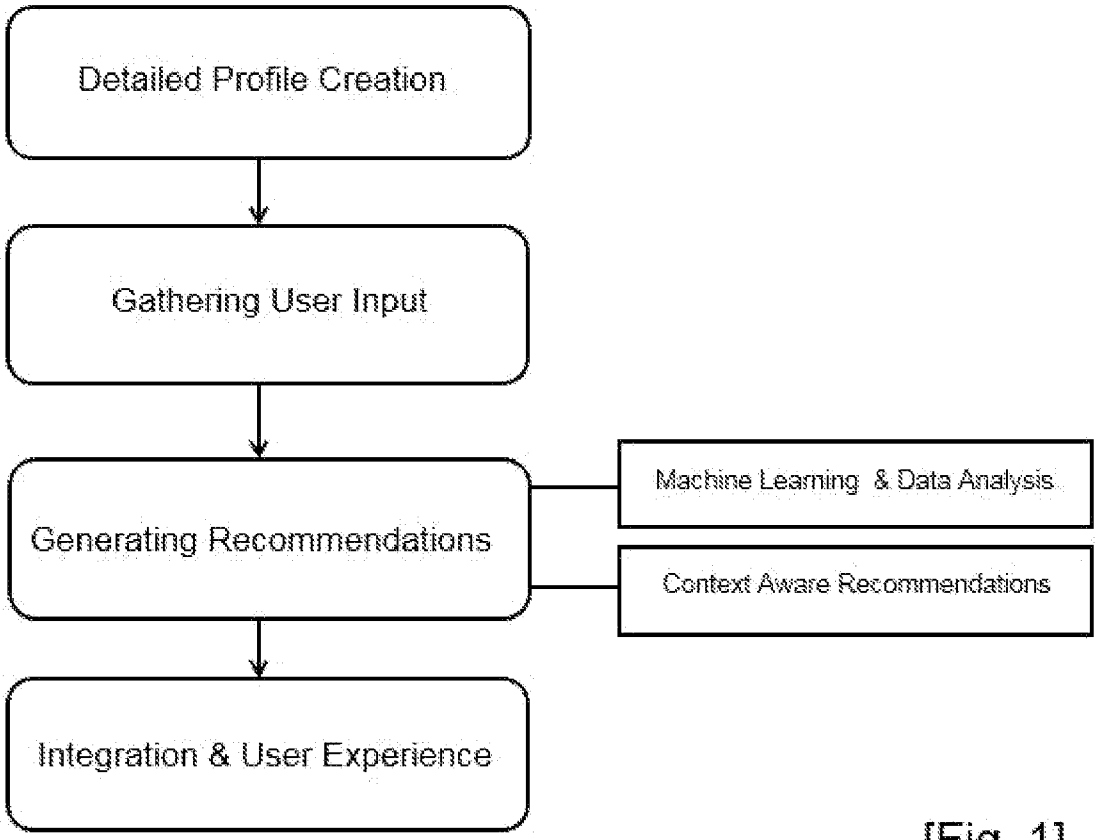

[Claim 2] According to claim 1, this software utilizes user input and profile creation, so the recommendaions will take into account the users' personal information, wardrobe inventory, event details, fashion trends, color theory, cultural context and social norms.

[Claim 3] According to claim 1, the software has the ability to be context-aware and understands the specific event and the target audience in order to tailor its recommendations to ensure appropriateness and style.

[Claim 4] According to claim 1, the software will be available as a mobile app and a web-based platform, ensuring accessibility and convenience.

[Claim 5] According to claim 1, the software features an interactive interface, a virtual fitting room, social sharing and e-commerce integration.

[Claim 6] According to claim 1, the software will employ reinforcement learning techniques to continuously refine its recommendations and become more precise and personalized.
